Paramount+ Content Performance Analysis

Eric Timberlake

ISBA 4715 — Data Analyst | May 2026

1 / 12

Business Question

"Which content attributes define high-performing streaming titles — and what does that tell Paramount+ about where to invest?"

Data source: TMDB (The Movie Database)

Scope: 2,500+ movies and TV shows with 50+ votes

Pipeline: TMDB API → Snowflake RAW → dbt STAGING → dbt MART → Streamlit

Target role: Analyst, Marketing Analytics @ Paramount+

Data Pipeline

```
TMDB API ██████████ tmdb_extract.py ██████████ Snowflake RAW
Paramount IR/Press ██████ firecrawl_extract.py ██████ Snowflake RAW
■
dbt staging models
(stg_tmdb_content,
stg_tmdb_genres)
■
dbt mart – star schema
(fct + 3 dimensions)
■
Streamlit Dashboard
(deployed: Community Cloud)
```

Orchestration: GitHub Actions — daily scheduled pipeline run

Star Schema

#### content_sk (PK) #### dim_genre
#### content_type ■ #### genre_sk (PK)
#### title ■ #### genre_name
#### popularity_score ■ #### content_type
#### vote_average ■
#### vote_count #### dim_date
#### release_year ##### release_year (PK)
#### primary_genre_id ##### decade
#### origin_country ##### era (classic / streaming / post-covid)
#### original_language ■
#### dim_studio
#### studio_sk (PK)
#### origin_country
#### original_language
```

Insight 1 — Genre Popularity

Action and Drama dominate popularity across both movies and TV

Genre	Signal	Finding
Action	Popularity	Highest average popularity score — drives algorithmic recommendations
Drama	Popularity + Rating	Top in both volume and vote average
Documentary	Vote Average	Leads in quality signal despite lower popularity
History	Vote Average	Punches above its weight on audience satisfaction

So what: Paramount+ should prioritize Action and Drama originals to maximize subscriber acquisition; Documentary/History investment yields quality credibility with niche audiences.

Insight 2 — Movie vs. TV Shift

TV's share of high-performing content has grown every decade since 1990

- **Pre-streaming (pre-2010):** movies dominate title volume and popularity
- **Streaming era (2010–2019):** TV rises sharply in both volume and popularity score
- **Post-COVID (2020+):** TV content accounts for the majority of top-popularity titles; movie volume declines relative to TV

So what: Investing in serialized TV originals — especially franchise-driven series — aligns with both audience behavior and Paramount+'s subscription retention playbook (Yellowstone, Sheridan universe, Star Trek).

Insight 3 — Catalog vs. New Releases

Post-COVID titles outperform catalog on popularity — but catalog wins on ratings

Era	Signal	Pattern
Classic (pre-1990)	Vote Average	Highest ratings — surviving catalog earns sustained quality
Streaming Era (2010–2019)	Balanced	Middle ground on both metrics
Post-COVID (2020+)	Popularity Score	Newest content benefits most from algorithmic exposure

So what: Marketing spend allocation should differ by goal — amplify new originals for subscriber acquisition; surface high-rated classic catalog for engagement and retention.

Insight 4 — Reach vs. Quality

Vote count (reach) and vote average (quality) are largely independent signals

- Pearson $r \approx 0.1-0.2$ — weak positive correlation overall
- Higher vote counts do not reliably predict higher ratings
- Non-English content (Korean `ko`, Japanese `ja`, Spanish `es`) leads in vote average despite lower global vote counts — quality punches above reach

So what: Reach and quality require different marketing levers. High vote-count titles need reach amplification; high-rated low-reach titles need awareness campaigns to convert latent quality into subscriber acquisition.

Insight 5 — International Content Quality

Non-English originals outperform English content on audience satisfaction

Language	Pattern
Korean (`ko`)	Consistently top vote averages — Squid Game effect
Japanese (`ja`)	Strong ratings across anime and drama
Spanish (`es`)	High engagement; growing global audience
English (`en`)	Dominates volume but middle-of-pack on vote average

So what: Co-productions and acquisitions from Korea, Japan, and Spain represent a high-quality, potentially lower-cost path to content differentiation — directly relevant to Paramount+'s international expansion thesis.

Recommendations for Paramount+

- **Prioritize Action and Drama TV originals** — this genre-type combination has the highest average popularity score and aligns with the Sheridan universe franchise model (Yellowstone, Landman, 1923).
- **Differentiate reach vs. quality in media spend** — allocate performance marketing budget toward new originals for subscriber acquisition; allocate content marketing budget toward surfacing high-rated catalog titles for retention.
- **Expand international co-production pipeline** — Korean and Japanese originals consistently outperform on quality metrics. The data supports pursuing more titles in these markets alongside Paramount+'s existing English-language dominance.

Knowledge Base

Paramount+ strategy context drawn from **17 scraped sources** across 3 domains:

Source Type	Key Findings
Paramount Global IR (9 quarterly earnings)	Subscriber trajectory 100K (2015) → 79M (2025); DTC profitability focus po
Paramount Press Express	Taylor Sheridan universe as #1 franchise bet; The Madison (8M views debu
Wikipedia (8 pages)	Full competitive context: streaming wars, SVOD model, platform history, bra

Connection to TMDb analysis: Data confirms Paramount+'s stated bets — Action/Drama TV dominance, post-COVID popularity surge, international quality opportunity.

Portfolio Summary

Project: Streaming Marketing Analytics — Paramount+

Repo: github.com/etimber-sys/Media-Marketing-Analyst

Skill	Demonstrated
SQL + Data Modeling	dbt star schema — 1 fact table, 3 dimensions
Pipeline Engineering	Python extract, Snowflake load, GitHub Actions daily schedule
Analytics	6 descriptive + diagnostic business questions answered
Visualization	Streamlit + Plotly — 4 tabs, interactive filters
Domain Knowledge	17 Paramount+ sources, 3 wiki synthesis pages

Target role: Analyst, Marketing Analytics @ Paramount+
